

Fish APP — File Manifest for Laptop Migration

Source folder: C:\CLAUDE\Fish APP | Generated: July 25, 2026 (America/New_York) | Files: 45 | Total size: 1,637,343 bytes (~1.6 MB)

How to verify on the new laptop: give Claude this document (or the matching FishApp_File_Manifest.csv) and ask it to compare against the copied folder. Every file below should exist with the exact same size and SHA-256 checksum. The checksum is a fingerprint of the file contents — if it matches, the file copied over perfectly, even if the modified date shifted during the move.

Intentionally excluded (machine-generated, safe to not copy): .venv\ (Python virtual environment — recreate on the new laptop with: `python -m venv .venv` then `pip install -r requirements.txt`), __pycache__\ folders and .pyc files (auto-regenerated), .pytest_cache\ (test cache). The .git\ folder (version history) was not itemized file-by-file, but if you copy the whole folder it comes along; run `git status` on the new laptop to confirm it is intact. **Note:** .streamlit\secrets.toml contains credentials — make sure it transfers, since it is often skipped by backup tools.

Grand total: 45 files, 1,637,343 bytes. A quick spot-check without Claude: right-click the folder → Properties on the new laptop; file counts will be higher because of .venv/.git/caches, but these 45 files are the ones that matter.
